EP 0 996 785 B1

Description**TECHNICAL FIELD**

- 5 [0001] This invention relates to a method of reducing the pilling propensity and/or improve the colour clarity of polyester fabrics and/or garments, which method comprises treating the fabric with a polyester hydrolytic enzyme.

BACKGROUND ART

- 10 [0002] Poly(ethylene terephthalate) fibers accounts for the main part of the polyester applied by the textile industry. The fibers are produced by e.g. poly-condensation of terephthalic acid and ethylene glycol, and drawing of fibers from a melt.
- [0003] Because of its strength, polyester fabrics and/or garments are subject to pill formation, and possibly the most important of the cloth-finishing processes applied to polyester staple-fibre materials are those designed for control of pilling. All staple-fibre materials tend to form small balls or "pills" of entangled fibres at the cloth surface, when subjected to mild abrasion during wash and wear. If the fabric contains a substantial proportion of fibres having high resistance to flexural abrasion, the pills may be retained on the surface of the cloth in sufficient numbers to produce an unpleasant handle and appearance.
- 15 [0004] There is no simple solution to the problem of pilling. In the textile industry, polyester fibers are produced as medium- and high-tenacity filament yarns and as staple fibers of various lengths and fiber color to suit the kind of spinning machinery found in the textile trade. Staple fibers are usually drawn to give medium tenacities, but may be spun from polymers of lower average molecular weight to give improved "pilling" performance at the expense of some loss in abrasion resistance. Also, the finisher may reduce the pilling propensity of a fabric by the removal of protruding hairs from the surface of the cloth and by heat treatment to reduce the tendency of the fibres to migrate within the yarns.
- 20 [0005] WO 96/17994 discloses a method of treating a cellulose-fiber-containing textile fabric with a cellulase to obtain a fabric having a strongly reduced tendency of pilling formation at a significantly reduced weight loss. The method may be carried out simultaneously with other fabric manufacturing procedures.
- [0006] These are all solutions to the problem of pilling applied by the textile industry.
- 25 [0007] WO 96/34092 discloses the use of single cellulases which are capable of cleaning, antiredeposition, colour clarification and antipilling performance in laundry washing.
- 30

SUMMARY OF THE INVENTION

- 35 [0008] It has now surprisingly been found that certain polyester hydrolytic enzymes are capable of reducing the pilling propensity of polyester fabrics and garments. In particular it has been found that a group of ethyleneglycol dibenzyl ester (BEB) and/or terephthalic acid diethyl ester (ETE) hydrolytic enzymes are capable of reducing pilling propensity of polyester fabrics and garments. Furthermore, it has been found that the treatment with ethyleneglycol dibenzyl ester (BEB) and/or terephthalic acid diethyl ester (ETE) hydrolytic enzymes is capable of colour clarification of polyester fabrics and/or garments.
- 40 [0009] Accordingly, in its first aspect, the invention provides a method of reducing the pilling propensity of polyester fabrics and/or garments, which method comprises treating the fabric or garment with a terephthalic acid diethyl ester hydrolytic enzyme and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme, and which method is carried out simultaneously with laundering of the fabric and/or garment in presence of a detergent.
- [0010] In another aspect, the invention relates to the use of a terephthalic acid diethyl ester hydrolytic enzyme and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme in a method for reducing the pilling propensity of polyester fabrics and/or garments which method is carried out simultaneously with laundering of the fabric and/or garment.
- 45 [0011] In a further aspect, the invention provides a method of colour clarification of polyester fabrics and/or garments, which method comprises treating the fabric or garment with a terephthalic acid diethyl ester hydrolytic enzyme and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme, and which method is carried out simultaneously with laundering of the fabric and/or garment in presence of a detergent.
- 50 [0012] In yet another aspect, the invention relates to the use of a terephthalic acid diethyl ester hydrolytic enzyme and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme in a method of colour clarification of polyester fabrics and/or garments which method is carried out simultaneously with laundering of the fabric and/or garment.

DETAILED DISCLOSURE OF THE INVENTION

- 55 [0013] The invention provides a method of reducing the pilling propensity of polyester fabrics and/or garments. The invention furthermore provides a method of improving the colour clarity of polyester fabrics and/or garments.

Polyester Fabrics or Garments

[0014] The polyester fabrics and/or garments treated according to the method of the invention may be any fabric or fabric blend comprising polyester. Actually, the pilling propensity is most pronounced in fabrics and/or garments comprising polyester fibers in blends with fibers of a different material.

[0015] In a preferred embodiment the fabric is a fabric blend comprising more than 50% (w/w) of polyester, in particular more than 75% (w/w) of polyester, more than 90% (w/w) of polyester, or more than 95% (w/w) of polyester. In a most preferred embodiment, the process of the invention is applied to fabrics or garments consisting essentially of poly(ethylene terephthalate) polyester material, i.e. pure poly(ethylene terephthalate) polyester material.

Polyester Hydrolytic Enzymes

[0016] The method of the invention comprises treating the fabric or garment with a polyester hydrolytic enzyme. It has surprisingly been found that a certain group of enzymes are capable of hydrolysing terephthalic acid diethyl ester (ETE) and/or an ethyleneglycol dibenzyl ester (BEB), and therefore are polyesterhydrolytic enzymes.

[0017] Determination of which enzymes are ETE and/or BEB hydrolytic enzyme may be carried out as described in Example 1, below.

[0018] The method of the invention comprises treating the fabric or garment with a ETE hydrolytic enzyme and/or a BEB hydrolytic enzyme and a detergent. In a preferred embodiment, the method of the invention comprises treating the fabric or garment with a ETE hydrolytic enzyme. In another preferred embodiment, the method of the invention comprises treating the fabric or garment with a BEB hydrolytic enzyme. The BEB hydrolytic enzyme may in particular be a BEB¹⁰ hydrolytic enzyme or BEB³⁰ hydrolytic enzyme, as defined in Example 1, below. Preferably the ETE hydrolytic enzyme has a hydrolytic activity of at least 50%, more preferably of at least 90% and most preferably of at least 95%. Preferably the BEB¹⁰ or BEB³⁰ hydrolytic enzyme has a hydrolytic activity of at least 50%, more preferably at least 90% and most preferably at least 95%. In a most preferred embodiment both the BEB¹⁰, BEB³⁰ and ETE hydrolytic activity are at least 50%, more preferably at least 90% and most preferably at least 95%.

[0019] ETE hydrolytic enzyme and/or a BEB hydrolytic enzyme may be obtained from any convenient source. Preferably the ETE hydrolytic enzyme and/or BEB hydrolytic enzyme is obtained from a microbial source. In a more preferred embodiment, the ETE hydrolytic enzyme and/or BEB hydrolytic enzyme is obtained from a strain of *Candida*, in particular *Candida antarctica* and *Candida cylindracea* (syn. *Candida rugosa*), a strain of *Humicola*, in particular *Humicola insolens*, a strain of *Pseudomonas*, in particular *Pseudomonas cepacia*.

The treatment

[0020] The present invention provides a method of reducing the pilling propensity of polyester fabrics and/or garments. Furthermore, the present invention provides a method of improving the colour clarification of polyester fabrics and/or garments.

[0021] Enzyme dosage must be a function of the enzyme(s) applied and the reaction time and conditions given. It is at present contemplated that the enzyme(s) may be dosed in a total amount of from about 0.05 micro gram per gram fabrics and/or garments to about 5000 microgram per gram fabrics and/or garments.

[0022] The enzymatic treatment may be carried out in the temperature range of from about 30°C to about 100°C, preferentially from about 40°C to about 90°C. The pH range may, dependent on the enzyme(s) applied, be from about pH 5 to pH 11 preferably from about pH 7 to pH 11. It is at present contemplated that a suitable reaction time may be in the range of from about 15 minutes to about 3 hours. The detergent may be used in an amount of from about 0.001 g/l wash liquor to about 10 g/l wash liquor.

[0023] The treatment is carried out simultaneously with a conventional laundry process, and is carried out in presence of a detergent. In a more preferred embodiment, the method of the invention is carried out in the presence of a detergent enzyme, in particular a proteolytic enzyme, a lipolytic enzyme, a cellulytic enzyme, an amylolytic enzyme, an oxidase enzyme, a peroxidase enzyme, and a pectinase enzyme, or mixtures hereof. In a particularly preferred embodiment, the method of the invention is carried out in presence of a detergent and a cellulytic enzyme. The method is preferably carried out by incorporating the above terephthalic acid diethyl ester hydrolytic enzyme and/or ethyleneglycol dibenzyl ester hydrolytic enzyme in a laundry detergent composition.

Detergent

[0024] In the context of this invention, a detergent is synonymous with a surfactant, and it may in particular be a nonionic surfactant, an anionic surfactant, a cationic surfactant, an ampholytic surfactant, a zwitterionic surfactant, and a semi-polar surfactant, or a mixture hereof.

[0025] The surfactant is typically present in a detergent composition at a level from 0.1% to 60% by weight.

[0026] The surfactant is preferably formulated to be compatible with enzyme components present in the composition. In liquid or gel compositions the surfactant is most preferably formulated in such a way that it promotes, or at least does not degrade, the stability of any enzyme in these compositions.

[0027] Preferred systems to be used according to the present invention comprise as a surfactant one or more of the nonionic and/or anionic surfactants described herein.

[0028] Polyethylene, polypropylene, and polybutylene oxide condensates of alkyl phenols are suitable for use as the nonionic surfactant of the surfactant systems of the present invention, with the polyethylene oxide condensates being preferred. These compounds include the condensation products of alkyl phenols having an alkyl group containing from about 6 to about 14 carbon atoms, preferably from about 8 to about 14 carbon atoms, in either a straight chain or branched-chain configuration with the alkylene oxide. In a preferred embodiment, the ethylene oxide is present in an amount equal to from about 2 to about 25 moles, more preferably from about 3 to about 15 moles, of ethylene oxide per mole of alkyl phenol. Commercially available nonionic surfactants of this type include Igepal™ CO-630, marketed by the GAF Corporation; and Triton™ X-45, X-114, X-100 and X-102, all marketed by the Rohm & Haas Company.

These surfactants are commonly referred to as alkylphenol alkoxylates (e.g., alkyl phenol ethoxylates).

[0029] The condensation products of primary and secondary aliphatic alcohols with about 1 to about 25 moles of ethylene oxide are suitable for use as the nonionic surfactant of the nonionic surfactant systems of the present invention.

The alkyl chain of the aliphatic alcohol can either be straight or branched, primary or secondary, and generally contains from about 8 to about 22 carbon atoms. Preferred are the condensation products of alcohols having an alkyl group containing from about 8 to about 20 carbon atoms, more preferably from about 10 to about 18 carbon atoms, with from about 2 to about 10 moles of ethylene oxide per mole of alcohol. About 2 to about 7 moles of ethylene oxide and most preferably from 2 to 5 moles of ethylene oxide per mole of alcohol are present in said condensation products. Examples of commercially available nonionic surfactants of this type include Tergitol™ 15-S-9 (The condensation product of C₁₁-C₁₅ linear alcohol with 9 moles ethylene oxide), Tergitol™ 24-L-6 NMW (the condensation product of C₁₂-C₁₄ primary alcohol with 6 moles ethylene oxide with a narrow molecular weight distribution), both marketed by Union Carbide Corporation; Neodol™ 45-9 (the condensation product of C₁₄-C₁₅ linear alcohol with 9 moles of ethylene oxide), Neodol™ 23-3 (the condensation product of C₁₂-C₁₃ linear alcohol with 3.0 moles of ethylene oxide), Neodol™ 45-7 (the condensation product of C₁₄-C₁₅ linear alcohol with 7 moles of ethylene oxide), Neodol™ 45-5 (the condensation product of C₁₄-C₁₅ linear alcohol with 5 moles of ethylene oxide) marketed by Shell Chemical Company, Kyro™ EOB (the condensation product of C₁₃-C₁₅ alcohol with 9 moles ethylene oxide), marketed by The Procter & Gamble Company, and Genapol LA 050 (the condensation product of C₁₂-C₁₄ alcohol with 5 moles of ethylene oxide) marketed by Hoechst. Preferred range of HLB in these products is from 8-11 and most preferred from 8-10.

[0030] Also useful as the nonionic surfactant of the surfactant systems of the present invention are alkylpolysaccharides disclosed in US 4,565,647, having a hydrophobic group containing from about 6 to about 30 carbon atoms, preferably from about 10 to about 16 carbon atoms and a polysaccharide, e.g. a polyglycoside, hydrophilic group containing from about 1.3 to about 10, preferably from about 1.3 to about 3, most preferably from about 1.3 to about 2.7 saccharide units. Any reducing saccharide containing 5 or 6 carbon atoms can be used, e.g., glucose, galactose and galactosyl moieties can be substituted for the glucosyl moieties (optionally the hydrophobic group is attached at the 2-, 3-, 4-, etc. positions thus giving a glucose or galactose as opposed to a glucoside or galactoside). The intersaccharide bonds can be, e.g., between the one position of the additional saccharide units and the 2-, 3-, 4-, and/or 6-positions on the preceding saccharide units.

[0031] The preferred alkylpolyglycosides have the formula

wherein R² is selected from the group consisting of alkyl, alkylphenyl, hydroxyalkyl, hydroxyalkylphenyl, and mixtures thereof in which the alkyl groups contain from about 10 to about 18, preferably from about 12 to about 14, carbon atoms; n is 2 or 3, preferably 2; t is from 0 to about 10, preferably 0; and x is from about 1.3 to about 10, preferably from about 1.3 to about 3, most preferably from about 1.3 to about 2.7. The glycosyl is preferably derived from glucose. To prepare these compounds, the alcohol or alkylpolyethoxy alcohol is formed first and then reacted with glucose, or a source of glucose, to form the glucoside (attachment at the 1-position). The additional glycosyl units can then be attached between their 1-position and the preceding glycosyl units 2-, 3-, 4-, and/or 6-position, preferably predominantly the 2-position.

[0032] The condensation products of ethylene oxide with a hydrophobic base formed by the condensation of propylene oxide with propylene glycol are also suitable for use as the additional nonionic surfactant systems of the present invention. The hydrophobic portion of these compounds will preferably have a molecular weight from about 1500 to about 1800 and will exhibit water insolubility. The addition of polyoxyethylene moieties to this hydrophobic portion tends

to increase the water solubility of the molecule as a whole, and the liquid character of the product is retained up to the point where the polyoxyethylene content is about 50% of the total weight of the condensation product, which corresponds to condensation with up to about 40 moles of ethylene oxide. Examples of compounds of this type include certain of the commercially available Pluronic™ surfactants, marketed by BASF.

[0033] Also suitable for use as the nonionic surfactant of the nonionic surfactant system of the present invention, are the condensation products of ethylene oxide with the product resulting from the reaction of propylene oxide and ethylenediamine. The hydrophobic moiety of these products consists of the reaction product of ethylenediamine and excess propylene oxide, and generally has a molecular weight of from about 2500 to about 3000. This hydrophobic moiety is condensed with ethylene oxide to the extent that the condensation product contains from about 40% to about 80% by weight of polyoxyethylene and has a molecular weight of from about 5,000 to about 11,000. Examples of this type of nonionic surfactant include certain of the commercially available Tetronic™ compounds, marketed by BASF.

[0034] Preferred for use as the nonionic surfactant of the surfactant systems of the present invention are polyethylene oxide condensates of alkyl phenols, condensation products of primary and secondary aliphatic alcohols with from about 1 to about 25 moles of ethyleneoxide, alkylpolysaccharides, and mixtures hereof. Most preferred are C₈-C₁₄ alkyl phenol ethoxylates having from 3 to 15 ethoxy groups and C₈-C₁₈ alcohol ethoxylates (preferably C₁₀ avg.) having from 2 to 10 ethoxy groups, and mixtures thereof.

Highly preferred nonionic surfactants are polyhydroxy fatty acid amide surfactants of the formula

wherein R¹ is H, or R¹ is C₁₋₄ hydrocarbyl, 2-hydroxyethyl, 2-hydroxypropyl or a mixture thereof, R² is C₅₋₃₁ hydrocarbyl, and Z is a polyhydroxyhydrocarbyl having a linear hydrocarbyl chain with at least 3 hydroxyls directly connected to the chain, or an alkoxylated derivative thereof. Preferably, R¹ is methyl, R² is straight C₁₁₋₁₅ alkyl or C₁₆₋₁₈ alkyl or alkenyl chain such as coconut alkyl or mixtures thereof, and Z is derived from a reducing sugar such as glucose, fructose, maltose or lactose, in a reductive amination reaction.

[0035] Highly preferred anionic surfactants include alkyl alkoxylated sulfate surfactants. Examples hereof are water soluble salts or acids of the formula RO(A)_mSO₃M wherein R is an unsubstituted C₁₀-C₂₄ alkyl or hydroxyalkyl group having a C₁₀-C₂₄ alkyl component, preferably a C₁₂-C₂₀ alkyl or hydroxyalkyl, more preferably C₁₂-C₁₈ alkyl or hydroxyalkyl, A is an ethoxy or propoxy unit, m is greater than zero, typically between about 0.5 and about 6, more preferably between about 0.5 and about 3, and M is H or a cation which can be, for example, a metal cation (e.g., sodium, potassium, lithium, calcium, magnesium, etc.), ammonium or substituted-ammonium cation. Alkyl ethoxylated sulfates as well as alkyl propoxylated sulfates are contemplated herein. Specific examples of substituted ammonium cations include methyl-, dimethyl-, trimethyl-ammonium cations and quaternary ammonium cations such as tetramethyl-ammonium and dimethyl piperdinium cations and those derived from alkylamines such as ethylamine, diethylamine, triethylamine, mixtures thereof, and the like. Exemplary surfactants are C₁₂-C₁₈ alkyl polyethoxylate (1.0) sulfate (C₁₂-C₁₈E(1.0)M), C₁₂-C₁₈ alkyl polyethoxylate (2.25) sulfate (C₁₂-C₁₈(2.25)M), and C₁₂-C₁₈ alkyl polyethoxylate (3.0) sulfate (C₁₂-C₁₈E(3.0)M), and C₁₂-C₁₈ alkyl polyethoxylate (4.0) sulfate (C₁₂-C₁₈E(4.0)M), wherein M is conveniently selected from sodium and potassium. Suitable anionic surfactants to be used are alkyl ester sulfonate surfactants including linear esters of C₈-C₂₀ carboxylic acids (i.e., fatty acids) which are sulfonated with gaseous SO₃ according to "The Journal of the American Oil Chemists Society", 52 (1975), pp. 323-329. Suitable starting materials would include natural fatty substances as derived from tallow, palm oil, etc.

[0036] The preferred alkyl ester sulfonate surfactant, especially for laundry applications, comprise alkyl ester sulfonate surfactants of the structural formula:

wherein R³ is a C₈-C₂₀ hydrocarbyl, preferably an alkyl, or combination thereof, R⁴ is a C₁-C₆ hydrocarbyl, preferably an alkyl, or combination thereof, and M is a cation which forms a water soluble salt with the alkyl ester sulfonate. Suitable salt-forming cations include metals such as sodium, potassium, and lithium, and substituted or unsubstituted ammonium cations, such as monoethanolamine, diethanolamine, and triethanolamine. Preferably, R³ is C₁₀-C₁₆ alkyl, and R⁴ is methyl, ethyl or isopropyl. Especially preferred are the methyl ester sulfonates wherein R³ is C₁₀-C₁₆ alkyl.

[0037] Other suitable anionic surfactants include the alkyl sulfate surfactants which are water soluble salts or acids of the formula ROSO₃M wherein R preferably is a C₁₀-C₂₄ hydrocarbyl, preferably an alkyl or hydroxyalkyl having a C₁₀-C₂₀ alkyl component, more preferably a C₁₂-C₁₈ alkyl or hydroxyalkyl, and M is H or a cation, e.g., an alkali metal cation (e.g. sodium, potassium, lithium), or ammonium or substituted ammonium (e.g. methyl-, dimethyl-, and trimethyl ammonium cations and quaternary ammonium cations such as tetramethyl-ammonium and dimethyl piperdinium cations and quaternary ammonium cations derived from alkylamines such as ethylamine, diethylamine, triethylamine, and mixtures thereof, and the like). Typically, alkyl chains of C₁₂-C₁₆ are preferred for lower wash temperatures (e.g. below about 50°C) and C₁₆-C₁₈ alkyl chains are preferred for higher wash temperatures (e.g. above about 50°C).

[0038] Other anionic surfactants useful for deterative purposes can also be included in the laundry detergent compositions of the present invention. These can include salts (including, for example, sodium, potassium, ammonium, and substituted ammonium salts such as mono- di- and triethanolamine salts) of soap, C₈-C₂₂ primary or secondary alkanesulfonates, C₈-C₂₄ olefinsulfonates, sulfonated polycarboxylic acids prepared by sulfonation of the pyrolyzed product of alkaline earth metal citrates, e.g., as described in British patent specification No. 1,082,179, C₈-C₂₄ alkyl-polyglycoethersulfates (containing up to 10 moles of ethylene oxide); alkyl glycerol sulfonates, fatty acyl glycerol sulfonates, fatty oleyl glycerol sulfates, alkyl phenol ethylene oxide ether sulfates, paraffin sulfonates, alkyl phosphates, isethionates such as the acyl isethionates, N-acyl taurates, alkyl succinamates and sulfosuccinates, monoesters of sulfosuccinates (especially saturated and unsaturated C₁₂-C₁₈ monoesters) and diesters of sulfosuccinates (especially saturated and unsaturated C₆-C₁₂ diesters), acyl sarcosinates, sulfates of alkylpolysaccharides such as the sulfates of alkylpolyglucoside (the nonionic nonsulfated compounds being described below), branched primary alkyl sulfates, and alkyl polyethoxy carboxylates such as those of the formula RO(CH₂CH₂O)_k-CH₂COO-M⁺ wherein R is a C₈-C₂₂ alkyl, k is an integer from 1 to 10, and M is a soluble salt forming cation. Resin acids and hydrogenated resin acids are also suitable, such as rosin, hydrogenated rosin, and resin acids and hydrogenated resin acids present in or derived from tall oil.

[0039] Alkylbenzene sulfonates are highly preferred. Especially preferred are linear (straight-chain) alkyl benzene sulfonates (LAS) wherein the alkyl group preferably contains from 10 to 18 carbon atoms.

[0040] Further examples are described in "Surface Active Agents and Detergents" (Vol. I and II by Schwartz, Perry and Berch). A variety of such surfactants are also generally disclosed in US 3,929,678, (Column 23, line 58 through Column 29, line 23, herein incorporated by reference).

[0041] When included therein, the laundry detergent compositions of the present invention typically comprise from about 1% to about 40%, preferably from about 3% to about 20% by weight of such anionic surfactants.

[0042] The laundry detergent compositions of the present invention may also contain cationic, ampholytic, zwitterionic, and semi-polar surfactants, as well as the nonionic and/or anionic surfactants other than those already described herein.

[0043] Cationic deterative surfactants suitable for use in the laundry detergent compositions of the present invention are those having one long-chain hydrocarbyl group. Examples of such cationic surfactants include the ammonium surfactants such as alkyltrimethylammonium halogenides, and those surfactants having the formula:

wherein R² is an alkyl or alkyl benzyl group having from about 8 to about 18 carbon atoms in the alkyl chain, each R³ is selected from the group consisting of -CH₂CH₂-, -CH₂CH(CH₃)-, -CH₂CH(CH₂OH)-, -CH₂CH₂CH₂-, and mixtures thereof; each R⁴ is selected from the group consisting of C₁-C₄ alkyl, C₁-C₄ hydroxyalkyl, benzyl ring structures formed by joining the two R⁴ groups, -CH₂CHOHCHOHCOR⁶CHOHCH₂OH, wherein R⁶ is any hexose or hexose polymer having a molecular weight less than about 1000, and hydrogen when y is not 0; R⁵ is the same as R⁴ or is an alkyl chain, wherein the total number of carbon atoms of R² plus R⁵ is not more than about 18; each y is from 0 to about 10, and the sum of the y values is from 0 to about 15; and X is any compatible anion.

[0044] Highly preferred cationic surfactants are the water soluble quaternary ammonium compounds useful in the present composition having the formula:

wherein R_1 is C_8 - C_{16} alkyl, each of R_2 , R_3 and R_4 is independently C_1 - C_4 alkyl, C_1 - C_4 hydroxy alkyl, benzyl, and $-(C_2H_4)_xH$ where x has a value from 2 to 5, and X is an anion. Not more than one of R_2 , R_3 or R_4 should be benzyl.

[0045] The preferred alkyl chain length for R_1 is C_{12} - C_{15} , particularly where the alkyl group is a mixture of chain lengths derived from coconut or palm kernel fat or is derived synthetically by olefin build up or OXO alcohols synthesis.

[0046] Preferred groups for R_2 , R_3 and R_4 are methyl and hydroxyethyl groups and the anion X may be selected from halide, methosulphate, acetate and phosphate ions.

[0047] Examples of suitable quaternary ammonium compounds of formulae (i) for use herein are:

coconut trimethyl ammonium chloride or bromide;
 coconut methyl dihydroxyethyl ammonium chloride or bromide;
 decyl triethyl ammonium chloride;
 decyl dimethyl hydroxyethyl ammonium chloride or bromide;
 C_{12-15} dimethyl hydroxyethyl ammonium chloride or bromide;
 coconut dimethyl hydroxyethyl ammonium chloride or bromide;
 myristyl trimethyl ammonium methyl sulphate;
 lauryl dimethyl benzyl ammonium chloride or bromide;
 lauryl dimethyl (ethenoxy)₄ ammonium chloride or bromide;
 choline esters (compounds of formula (i) wherein R_1 is

di-alkyl imidazolines [compounds of formula (ii)].

[0048] Other cationic surfactants useful herein are also described in US 4,228,044 and in EP 000 224.

[0049] When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 25%, preferably from about 1% to about 8% by weight of such cationic surfactants.

[0050] Ampholytic surfactants are also suitable for use in the laundry detergent compositions of the present invention. These surfactants can be broadly described as aliphatic derivatives of secondary or tertiary amines, or aliphatic derivatives of heterocyclic secondary and tertiary amines in which the aliphatic radical can be straight- or branched-chain. One of the aliphatic substituents contains at least about 8 carbon atoms, typically from about 8 to about 18 carbon atoms, and at least one contains an anionic water-solubilizing group, e.g. carboxy, sulfonate, sulfate. See US 3,929,678 (column 19, lines 18-35) for examples of ampholytic surfactants.

[0051] When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 15%, preferably from about 1% to about 10% by weight of such ampholytic surfactants.

[0052] Zwitterionic surfactants are also suitable for use in laundry detergent compositions. These surfactants can be broadly described as derivatives of secondary and tertiary amines, derivatives of heterocyclic secondary and tertiary amines, or derivatives of quaternary ammonium, quaternary phosphonium or tertiary sulfonium compounds. See US 3,929,678 (column 19, line 38 through column 22, line 48) for examples of zwitterionic surfactants.

[0053] When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 15%, preferably from about 1% to about 10% by weight of such zwitterionic surfactants.

[0054] Semi-polar nonionic surfactants are a special category of nonionic surfactants which include water-soluble amine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; water-soluble phosphine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; and water-soluble sulfoxides containing one alkyl moiety from about 10 to about 18 carbon atoms and a moiety selected from the group consisting of alkyl and hydroxyalkyl moieties of from about 1 to about 3 carbon atoms.

[0055] Semi-polar nonionic detergent surfactants include the amine oxide surfactants having the formula:

wherein R^3 is an alkyl, hydroxyalkyl, or alkyl phenyl group or mixtures thereof containing from about 8 to about 22 carbon atoms; R^4 is an alkylene or hydroxyalkylene group containing from about 2 to about 3 carbon atoms or mixtures thereof; x is from 0 to about 3; and each R^5 is an alkyl or hydroxyalkyl group containing from about 1 to about 3 carbon atoms or a polyethylene oxide group containing from about 1 to about 3 ethylene oxide groups. The R^5 groups can be attached to each other, e.g., through an oxygen or nitrogen atom, to form a ring structure.

[0056] These amine oxide surfactants in particular include C_{10} - C_{18} alkyl dimethyl amine oxides and C_8 - C_{12} alkoxy ethyl dihydroxy ethyl amine oxides.

[0057] When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 15%, preferably from about 1% to about 10% by weight of such semi-polar nonionic surfactants.

Builder system

[0058] The compositions according to the present invention may further comprise a builder system. Any conventional builder system is suitable for use herein including aluminosilicate materials, silicates, polycarboxylates and fatty acids, materials such as ethylenediamine tetraacetate, metal ion sequestrants such as aminopolyphosphonates, particularly ethylenediamine tetramethylene phosphonic acid and diethylene triamine pentamethylenephosphonic acid. Though less preferred for obvious environmental reasons, phosphate builders can also be used herein.

[0059] Suitable builders can be an inorganic ion exchange material, commonly an inorganic hydrated aluminosilicate material, more particularly a hydrated synthetic zeolite such as hydrated zeolite A, X, B, HS or MAP.

[0060] Another suitable inorganic builder material is layered silicate, e.g. SKS-6 (Hoechst). SKS-6 is a crystalline layered silicate consisting of sodium silicate ($Na_2Si_2O_5$).

[0061] Suitable polycarboxylates containing one carboxy group include lactic acid, glycolic acid and ether derivatives thereof as disclosed in Belgian Patent Nos. 831,368, 821,369 and 821,370. Polycarboxylates containing two carboxy groups include the water-soluble salts of succinic acid, malonic acid, (ethylenedioxy) diacetic acid, maleic acid, diglycolic acid, tartaric acid, tartronic acid and fumaric acid, as well as the ether carboxylates described in German Offenlegungsschrift 2,446,686, and 2,446,487, US 3,935,257 and the sulfinyl carboxylates described in Belgian Patent No. 840,623. Polycarboxylates containing three carboxy groups include, in particular, water-soluble citrates, aconitrates and citraconates as well as succinate derivatives such as the carboxymethyloxysuccinates described in British Patent No. 1,379,241, lactoxysuccinates described in Netherlands Application 7205873, and the oxypolycarboxylate materials such as 2-oxa-1,1,3-propane tricarboxylates described in British Patent No. 1,387,447.

[0062] Polycarboxylates containing four carboxy groups include oxydisuccinates disclosed in British Patent No. 1,261,829, 1,1,2,2-ethane tetracarboxylates, 1,1,3,3-propane tetracarboxylates containing sulfo substituents include the sulfosuccinate derivatives disclosed in British Patent Nos. 1,398,421 and 1,398,422 and in US 3,936,448, and the sulfonated pyrolysed citrates described in British Patent No. 1,082,179, while polycarboxylates containing phosphone substituents are disclosed in British Patent No. 1,439,000.

[0063] Alicyclic and heterocyclic polycarboxylates include cyclopentane-cis,cis-cis-tetracarboxylates, cyclopentadienide pentacarboxylates, 2,3,4,5-tetrahydro-furan - cis, cis, cis-tetracarboxylates, 2,5-tetrahydro-furan-cis, dicarboxylates, 2,2,5,5,-tetrahydrofuran - tetracarboxylates, 1,2,3,4,5,6-hexane - hexacarboxylates and carboxymethyl derivatives of polyhydric alcohols such as sorbitol, mannitol and xylitol. Aromatic polycarboxylates include mellitic acid, pyromellitic acid and the phthalic acid derivatives disclosed in British Patent No. 1,425,343.

[0064] Of the above, the preferred polycarboxylates are hydroxy-carboxylates containing up to three carboxy groups per molecule, more particularly citrates.

[0065] Preferred builder systems for use in the present compositions include a mixture of a water-insoluble aluminosilicate builder such as zeolite A or of a layered silicate (SKS-6), and a water-soluble carboxylate chelating agent such as citric acid.

[0066] A suitable chelant for inclusion in the detergent compositions in accordance with the invention is ethylenediamine-N,N'-disuccinic acid (EDDS) or the alkali metal, alkaline earth metal, ammonium, or substituted ammonium salts thereof, or mixtures thereof. Preferred EDDS compounds are the free acid form and the sodium or magnesium salt thereof. Examples of such preferred sodium salts of EDDS include Na_2EDDS and Na_4EDDS . Examples of such preferred magnesium salts of EDDS include $MgEDDS$ and Mg_2EDDS . The magnesium salts are the most preferred for inclusion in compositions in accordance with the invention.

[0067] Preferred builder systems include a mixture of a water-insoluble aluminosilicate builder such as zeolite A, and a water soluble carboxylate chelating agent such as citric acid.

[0068] Other builder materials that can form part of the builder system for use in granular compositions include inorganic materials such as alkali metal carbonates, bicarbonates, silicates, and organic materials such as the organic phosphonates, amino polyalkylene phosphonates and amino polycarboxylates.

[0069] Other suitable water-soluble organic salts are the homo- or co-polymeric acids or their salts, in which the polycarboxylic acid comprises at least two carboxyl radicals separated from each other by not more than two carbon atoms.

[0070] Polymers of this type are disclosed in GB-A-1,596,756. Examples of such salts are polyacrylates of MW 2000-5000 and their copolymers with maleic anhydride, such copolymers having a molecular weight of from 20,000 to 70,000, especially about 40,000.

[0071] Detergency builder salts are normally included in amounts of from 5% to 80% by weight of the composition. Preferred levels of builder for liquid detergents are from 5% to 30%.

Other Enzymes

[0072] Preferred detergent compositions, in addition to the enzyme preparation of the invention, comprise other enzyme(s) which provides cleaning performance and/or fabric care benefits.

[0073] Such enzymes include other proteases, lipases, cutinases, amylases, cellulases, peroxidases, oxidases (e.g. laccases).

Proteases: Any protease suitable for use in alkaline solutions can be used. Suitable proteases include those of animal, vegetable or microbial origin. Microbial origin is preferred. Chemically or genetically modified mutants are included. The protease may be a serine protease, preferably an alkaline microbial protease or a trypsin-like protease. Examples of alkaline proteases are subtilisins, especially those derived from Bacillus, e.g., subtilisin Novo, subtilisin Carlsberg, subtilisin 309, subtilisin 147 and subtilisin 168 (described in WO 89/06279). Examples of trypsin-like proteases are trypsin (e.g. of porcine or bovine origin) and the Fusarium protease described in WO 89/06270.

[0074] Preferred commercially available protease enzymes include those sold under the trade names Alcalase, Savinase, Primase, Durazym, and Esperase by Novo Nordisk A/S (Denmark), those sold under the tradename Maxatase, Maxacal, Maxapem, Properase, Purafect and Purafect OXP by Genencor International, and those sold under the tradename Opticlean and Optimase by Solvay Enzymes. Protease enzymes may be incorporated into the compositions in accordance with the invention at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Lipases: Any lipase suitable for use in alkaline solutions can be used. Suitable lipases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included.

[0075] Examples of useful lipases include a Humicola lanuginosa lipase, e.g., as described in EP 258 068 and EP 305 216, a Rhizomucor miehei lipase, e.g., as described in EP 238 023, a Candida lipase, such as a C. antarctica lipase, e.g., the C. antarctica lipase A or B described in EP 214 761, a Pseudomonas lipase such as a P. alcaligenes and P. pseudoalcaligenes lipase, e.g., as described in EP 218 272, a P. cepacia lipase, e.g., as described in EP 331 376, a P. stutzeri lipase, e.g., as disclosed in GB 1,372,034, a P. fluorescens lipase, a Bacillus lipase, e.g., a B. subtilis lipase (Dartois et al., (1993), Biochemica et Biophysica acta 1131, 253-260), a B. stearothermophilus lipase (JP 64/744992) and a B. pumilus lipase (WO 91/16422).

[0076] Furthermore, a number of cloned lipases may be useful, including the Penicillium camembertii lipase described by Yamaguchi et al., (1991), Gene 103, 61-67), the Geotricum candidum lipase (Schimada, Y. et al., (1989), J. Biochem., 106, 383-388), and various Rhizopus lipases such as a R. delemar lipase (Hass, M.J et al., (1991), Gene 109, 117-113), a R. niveus lipase (Kugimiya et al., (1992), Biosci. Biotech. Biochem. 56, 716-719) and a R. oryzae lipase.

[0077] Especially suitable lipases are lipases such as M1 Lipase™, Luma fast™ and Lipomax™ (Genencor), Lipolase™ and Lipolase Ultra™ (Novo Nordisk A/S), and Lipase P "Amano" (Amano Pharmaceutical Co. Ltd.).

[0078] The lipases are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Amylases: Any amylase (α and/or β) suitable for use in alkaline solutions can be used. Suitable amylases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included. Amylases include, for example, α -amylases obtained from a special strain of B. licheniformis, described in more detail in GB 1,296,839. Commercially available amylases are Duramyl™, Termamyl™, Fungamyl™ and BAN™ (available from Novo Nordisk A/S) and Rap- idase™ and Maxamyl P™ (available from Genencor).

[0079] The amylases are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

5 Cellulases: In the present context, the term "cellulase or "cellulolytic enzyme" refers to an enzyme which catalyses the degradation of cellulose to glucose, cellobiose, triose and other celooligosaccharides. Cellulose is a polymer of glucose linked by beta-1,4-glucosidic bonds. Cellulose chains form numerous intra- and intermolecular hydrogen bonds, which result in the formation of insoluble cellulose microfibrils. Microbial hydrolysis of cellulose to glucose involves the following three major classes of cellulases: endo-1,4-beta-glucanases (EC 3.2.1.4), which cleave beta-1,4-glucosidic
10 links randomly throughout cellulose molecules; cellobiohydrolases (EC 3.2.1.91)(exoglucanases), which digest cellulose from the nonreducing end; and beta-glucosidases (EC 3.2.1.21), which hydrolyse cellobiose and low-molecular-mass cellooligosaccharides to release glucose. Most cellulases consist of a cellulose-binding domain (CBD) and a catalytic domain (CAD) separated by a linker rich in proline and hydroxy amino acid residues. In the specification and claims, the term "endoglucanase" is intended to denote enzymes with cellulolytic activity, especially endo-1,4-beta-glucanase
15 activity, which are classified in EC 3.2.1.4 according to the Enzyme Nomenclature (1992) and are capable of catalysing (endo)hydrolysis of 1,4-beta-D-glucosidic linkages in cellulose, lichenin and cereal beta-D-glucans including 1,4-linkages in beta-D-glucans also containing 1,3-linkages. Any cellulase suitable for use in alkaline solutions can be used. Suitable cellulases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included. Suitable cellulases are disclosed in US 4,435,307, which discloses fungal cellulases produced from Humicola insolens.
20 Especially suitable cellulases are the cellulases having colour care benefits. Examples of such cellulases are cellulases described in European patent application No. 0 495 257, WO 91/17243 and WO 96/29397.

[0080] Commercially available cellulases include Celluzyme™ and Denimax™ produced by a strain of Humicola insolens, (Novo Nordisk A/S), and KAC-500(B)™ (Kao Corporation).

25 [0081] Cellulases are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Peroxidases/Oxidases: Peroxidase enzymes are used in combination with hydrogen peroxide or a source thereof (e.g. a percarbonate, perborate or persulfate). Oxidase enzymes are used in combination with oxygen. Both types of
30 enzymes are used for "solution bleaching", i.e. to prevent transfer of a textile dye from a dyed fabric to another fabric when said fabrics are washed together in a wash liquor, preferably together with an enhancing agent as described in e.g. WO 94/12621 and WO 95/01426. Suitable peroxidases/oxidases include those of plant, bacterial or fungal origin. Chemically or genetically modified mutants are included.

35 [0082] Peroxidase and/or oxidase enzymes are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

40 [0083] Mixtures of the above mentioned enzymes are encompassed herein, in particular a mixture of a protease, an amylase, a lipase and/or a cellulase.

[0084] The enzyme of the invention, or any other enzyme incorporated in the detergent composition, is normally incorporated in the detergent composition at a level from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level from 0.01%
45 to 0.2% of enzyme protein by weight of the composition.

Bleaching agents: Additional optional detergent ingredients that can be included in the detergent compositions of the present invention include bleaching agents such as PB1, PB4 and percarbonate with a particle size of 400-800 microns. These bleaching agent components can include one or more oxygen bleaching agents and, depending upon the bleaching agent chosen, one or more bleach activators. When present oxygen bleaching compounds will typically be present
50 at levels of from about 1% to about 25%. In general, bleaching compounds are optional added components in non-liquid formulations, e.g. granular detergents.

[0085] The bleaching agent component for use herein can be any of the bleaching agents useful for detergent compositions including oxygen bleaches as well as others known in the art.

[0086] The bleaching agent suitable for the present invention can be an activated or non-activated bleaching agent.

55 [0087] One category of oxygen bleaching agent that can be used encompasses percarboxylic acid bleaching agents and salts thereof. Suitable examples of this class of agents include magnesium monoperoxyphthalate hexahydrate, the magnesium salt of meta-chloro perbenzoic acid, 4-nonylamino-4-oxoperoxybutyric acid and diperoxydodecanedioic acid. Such bleaching agents are disclosed in US 4,483,781, US 740,446, EP 0 133 354 and US 4,412,934. Highly

preferred bleaching agents also include 6-nonylamino-6-oxoperoxycaproic acid as described in US 4,634,551.

[0088] Another category of bleaching agents that can be used encompasses the halogen bleaching agents. Examples of hypohalite bleaching agents, for example, include trichloro isocyanuric acid and the sodium and potassium dichloroisocyanurates and N-chloro and N-bromo alkane sulphonamides. Such materials are normally added at 0.5-10% by weight of the finished product, preferably 1-5% by weight.

[0089] The hydrogen peroxide releasing agents can be used in combination with bleach activators such as tetraacetylenediamine (TAED), nonanoyloxybenzenesulfonate (NOBS, described in US 4,412,934), 3,5-trimethylhexanoyloxybenzenesulfonate (ISONOBS, described in EP 120 591) or pentaacetylglucose (PAG), which are perhydrolyzed to form a peracid as the active bleaching species, leading to improved bleaching effect. In addition, very suitable are the bleach activators C8(6-octanamido-caproyl) oxybenzene-sulfonate, C9(6-nonanamido caproyl) oxybenzenesulfonate and C10 (6-decanamido caproyl) oxybenzenesulfonate or mixtures thereof. Also suitable activators are acylated citrate esters such as disclosed in European Patent Application No. 91870207.7.

[0090] Useful bleaching agents, including peroxyacids and bleaching systems comprising bleach activators and per-oxygen bleaching compounds for use in cleaning compositions according to the invention are described in application USSN 08/136,626.

[0091] The hydrogen peroxide may also be present by adding an enzymatic system (i.e. an enzyme and a substrate therefore) which is capable of generation of hydrogen peroxide at the beginning or during the washing and/or rinsing process. Such enzymatic systems are disclosed in European Patent Application EP 0 537 381.

[0092] Bleaching agents other than oxygen bleaching agents are also known in the art and can be utilized herein. One type of non-oxygen bleaching agent of particular interest includes photoactivated bleaching agents such as the sulfonated zinc and/or aluminium phthalocyanines. These materials can be deposited upon the substrate during the washing process. Upon irradiation with light, in the presence of oxygen, such as by hanging clothes out to dry in the daylight, the sulfonated zinc phthalocyanine is activated and, consequently, the substrate is bleached. Preferred zinc phthalocyanine and a photoactivated bleaching process are described in US 4,033,718. Typically, detergent composition will contain about 0.025% to about 1.25%, by weight, of sulfonated zinc phthalocyanine.

[0093] Bleaching agents may also comprise a manganese catalyst. The manganese catalyst may, e.g., be one of the compounds described in "Efficient manganese catalysts for low-temperature bleaching", *Nature* 369, 1994, pp. 637-639.

Suds suppressors: Another optional ingredient is a suds suppressor, exemplified by silicones, and silica-silicone mixtures. Silicones can generally be represented by alkylated polysiloxane materials, while silica is normally used in finely divided forms exemplified by silica aerogels and xerogels and hydrophobic silicas of various types. These materials can be incorporated as particulates, in which the suds suppressor is advantageously releasably incorporated in a water-soluble or waterdispersible, substantially non surface-active detergent impermeable carrier. Alternatively the suds suppressor can be dissolved or dispersed in a liquid carrier and applied by spraying on to one or more of the other components.

[0094] A preferred silicone suds controlling agent is disclosed in US 3,933,672. Other particularly useful suds suppressors are the self-emulsifying silicone suds suppressors, described in German Patent Application DTOS 2,646,126. An example of such a compound is DC-544, commercially available from Dow Corning, which is a siloxane-glycol copolymer. Especially preferred suds controlling agent are the suds suppressor system comprising a mixture of silicone oils and 2-alkyl-alkanols. Suitable 2-alkyl-alkanols are 2-butyl-octanol which are commercially available under the trade name Isofol 12 R.

[0095] Such suds suppressor system are described in European Patent Application EP 0 593 841.

[0096] Especially preferred silicone suds controlling agents are described in European Patent Application No. 92201649.8. Said compositions can comprise a silicone/ silica mixture in combination with fumed nonporous silica such as Aerosil^R.

[0097] The suds suppressors described above are normally employed at levels of from 0.001% to 2% by weight of the composition, preferably from 0.01% to 1% by weight.

Other components: Other components used in detergent compositions may be employed such as soil-suspending agents, soil-releasing agents, optical brighteners, abrasives, bactericides, tarnish inhibitors, coloring agents, and/or encapsulated or nonencapsulated perfumes.

[0098] Especially suitable encapsulating materials are water soluble capsules which consist of a matrix of polysaccharide and polyhydroxy compounds such as described in GB 1,464,616.

[0099] Other suitable water soluble encapsulating materials comprise dextrans derived from ungelatinized starch acid esters of substituted dicarboxylic acids such as described in US 3,455,838. These acid-ester dextrans are, preferably, prepared from such starches as waxy maize, waxy sorghum, sago, tapioca and potato. Suitable examples of said encapsulation materials include N-Lok manufactured by National Starch. The N-Lok encapsulating material consists of a modified maize starch and glucose. The starch is modified by adding monofunctional substituted groups such as octenyl succinic acid anhydride.

[0100] Antiredeposition and soil suspension agents suitable herein include cellulose derivatives such as methylcellulose, carboxymethylcellulose and hydroxyethylcellulose, and homo- or co-polymeric polycarboxylic acids or their salts. Polymers of this type include the polyacrylates and maleic anhydride-acrylic acid copolymers previously mentioned as builders, as well as copolymers of maleic anhydride with ethylene, methylvinyl ether or methacrylic acid, the maleic anhydride constituting at least 20 mole percent of the copolymer. These materials are normally used at levels of from 0.5% to 10% by weight, more preferably from 0.75% to 8%, most preferably from 1% to 6% by weight of the composition.

[0101] Preferred optical brighteners are anionic in character, examples of which are disodium 4,4'-bis-(2-diethanolamino-4-anilino-s-triazin-6-ylamino)stilbene-2,2'-disulphonate, disodium 4,4'-bis-(2-morpholino-4-anilino-s-triazin-6-ylamino)stilbene-2,2'-disulphonate, disodium 4,4'-bis-(2,4-dianilino-s-triazin-6-ylamino)stilbene-2,2'-disulphonate, monosodium 4,4'-bis-(2,4-dianilino-s-triazin-6-ylamino)stilbene-2-sulphonate, disodium 4,4'-bis-(2-anilino-4-(N-methyl-N-2-hydroxyethylamino)-s-triazin-6-ylamino)stilbene-2,2'-disulphonate, di-sodium 4,4'-bis-(4-phenyl-2,1,3-triazol-2-yl)-stilbene-2,2'-disulphonate, di-sodium 4,4'-bis-(2-anilino-4-(1-methyl-2-hydroxyethylamino)-s-triazin-6-ylamino)stilbene-2,2'-disulphonate, sodium 2(stilbyl-4''-(naphtho-1',2':4,5)-1,2,3-triazole-2''-sulphonate and 4,4'-bis(2-sulphostyryl)biphenyl.

[0102] Other useful polymeric materials are the polyethylene glycols, particularly those of molecular weight 1000-10000, more particularly 2000 to 8000 and most preferably about 4000. These are used at levels of from 0.20% to 5% more preferably from 0.25% to 2.5% by weight. These polymers and the previously mentioned homo- or co-polymeric poly-carboxylate salts are valuable for improving whiteness maintenance, fabric ash deposition, and cleaning performance on clay, proteinaceous and oxidizable soils in the presence of transition metal impurities.

[0103] Soil release agents useful in compositions of the present invention are conventionally copolymers or terpolymers of terephthalic acid with ethylene glycol and/or propylene glycol units in various arrangements. Examples of such polymers are disclosed in US 4,116,885 and 4,711,730 and EP 0 272 033. A particular preferred polymer in accordance with EP 0 272 033 has the formula:

where PEG is $-(\text{OC}_2\text{H}_4)_n-$, PO is $(\text{OC}_3\text{H}_6\text{O})$ and T is $(\text{pOOC}_6\text{H}_4\text{CO})$.

[0104] Also very useful are modified polyesters as random copolymers of dimethyl terephthalate, dimethyl sulfoisophthalate, ethylene glycol and 1,2-propanediol, the end groups consisting primarily of sulphobenzoate and secondarily of mono esters of ethylene glycol and/or 1,2-propanediol. The target is to obtain a polymer capped at both end by sulphobenzoate groups, "primarily", in the present context most of said copolymers herein will be endcapped by sulphobenzoate groups. However, some copolymers will be less than fully capped, and therefore their end groups may consist of monoester of ethylene glycol and/or 1,2-propanediol, thereof consist "secondarily" of such species.

[0105] The selected polyesters herein contain about 46% by weight of dimethyl terephthalic acid, about 16% by weight of 1,2-propanediol, about 10% by weight ethylene glycol, about 13% by weight of dimethyl sulfoisophthalic acid and about 15% by weight of sulfoisophthalic acid, and have a molecular weight of about 3,000. The polyesters and their method of preparation are described in detail in EP 311 342.

Softening agents: Fabric softening agents can also be incorporated into laundry detergent compositions in accordance with the present invention. These agents may be inorganic or organic in type. Inorganic softening agents are exemplified by the smectite clays disclosed in GB-A-1 400898 and in US 5,019,292. Organic fabric softening agents include the water insoluble tertiary amines as disclosed in GB-A1 514 276 and EP 0 011 340 and their combination with mono C_{12} - C_{14} quaternary ammonium salts are disclosed in EP-B-0 026 528 and di-long-chain amides as disclosed in EP 0 242 919. Other useful organic ingredients of fabric softening systems include high molecular weight polyethylene oxide materials as disclosed in EP 0 299 575 and 0 313 146.

[0106] Levels of smectite clay are normally in the range from 5% to 15%, more preferably from 8% to 12% by weight, with the material being added as a dry mixed component to the remainder of the formulation. Organic fabric softening agents such as the water-insoluble tertiary amines or dilong chain amide materials are incorporated at levels of from 0.5% to 5% by weight, normally from 1% to 3% by weight whilst the high molecular weight polyethylene oxide materials and the water soluble cationic materials are added at levels of from 0.1% to 2%, normally from 0.15% to 1.5% by weight. These materials are normally added to the spray dried portion of the composition, although in some instances it may be more convenient to add them as a dry mixed particulate, or spray them as molten liquid on to other solid components of the composition.

Polymeric dye-transfer inhibiting agents: The detergent compositions according to the present invention may also comprise from 0.001% to 10%, preferably from 0.01% to 2%, more preferably from 0.05% to 1% by weight of polymeric dye-transfer inhibiting agents. Said polymeric dye-transfer inhibiting agents are normally incorporated into detergent compositions in order to inhibit the transfer of dyes from colored fabrics onto fabrics washed therewith. These polymers

have the ability of complexing or adsorbing the fugitive dyes washed out of dyed fabrics before the dyes have the opportunity to become attached to other articles in the wash.

[0107] Especially suitable polymeric dye-transfer inhibiting agents are polyamine N-oxide polymers, copolymers of N-vinylpyrrolidone and N-vinylimidazole, polyvinylpyrrolidone polymers, polyvinylloxazolidones and polyvinylimidazoles or mixtures thereof.

[0108] Addition of such polymers also enhances the performance of the enzymes according to the invention.

[0109] The detergent composition according to the invention can be in liquid, paste, gels, bars or granular forms.

[0110] Non-dusting granulates may be produced, e.g., as disclosed in US 4,106,991 and 4,661,452 (both to Novo Industri A/S) and may optionally be coated by methods known in the art. Examples of waxy coating materials are poly (ethylene oxide) products (polyethyleneglycol, PEG) with mean molecular weights of 1000 to 20000; ethoxylated nonylphenols having from 16 to 50 ethylene oxide units; ethoxylated fatty alcohols in which the alcohol contains from 12 to 20 carbon atoms and in which there are 15 to 80 ethylene oxide units; fatty alcohols; fatty acids; and mono- and di- and triglycerides of fatty acids. Examples of film-forming coating materials suitable for application by fluid bed techniques are given in GB 1483591.

[0111] Granular compositions according to the present invention can also be in "compact form", i.e. they may have a relatively higher density than conventional granular detergents, i.e. from 550 to 950 g/l; in such case, the granular detergent compositions according to the present invention will contain a lower amount of "Inorganic filler salt", compared to conventional granular detergents; typical filler salts are alkaline earth metal salts of sulphates and chlorides, typically sodium sulphate; "Compact" detergent typically comprise not more than 10% filler salt. The liquid compositions according to the present invention can also be in "concentrated form", in such case, the liquid detergent compositions according to the present invention will contain a lower amount of water, compared to conventional liquid detergents. Typically, the water content of the concentrated liquid detergent is less than 30%, more preferably less than 20%, most preferably less than 10% by weight of the detergent compositions.

[0112] The compositions of the invention may for example, be formulated as hand and machine laundry detergent compositions including laundry additive compositions and compositions suitable for use in the pretreatment of stained fabrics, rinse added fabric softener compositions, and compositions for use in general household hard surface cleaning operations and dishwashing operations.

[0113] The following examples are meant to exemplify compositions for the present invention, but are not necessarily meant to limit or otherwise define the scope of the invention.

[0114] In the detergent compositions, the abbreviated component identifications have the following meanings:

LAS	Sodium linear C ₁₂ alkyl benzene sulphonate
TAS	Sodium tallow alkyl sulphate
XYAS	Sodium C _{1X} - C _{1Y} alkyl sulfate
SS	Secondary soap surfactant of formula 2-butyl octanoic acid
25EY	A C ₁₂ - C ₁₅ predominantly linear primary alcohol condensed with an average of Y moles of ethylene oxide
45EY	A C ₁₄ - C ₁₅ predominantly linear primary alcohol condensed with an average of Y moles of ethylene oxide
XYEVS	C _{1X} - C _{1Y} sodium alkyl sulfate condensed with an average of Z moles of ethylene oxide per mole
Nonionic	C ₁₃ - C ₁₅ mixed ethoxylated/propoxylated fatty alcohol with an average degree of ethoxylation of 3.8 and an average degree of propoxylation of 4.5 sold under the tradename Plurafax LF404 by BASF GmbH
CFAA	C ₁₂ - C ₁₄ alkyl N-methyl glucamide
TFAA	C ₁₆ - C ₁₈ alkyl N-methyl glucamide
Silicate	Amorphous Sodium Silicate (SiO ₂ :Na ₂ O ratio = 2.0)
NaSKS-6	Crystalline layered silicate of formula δ-Na ₂ Si ₂ O ₅
Carbonate	Anhydrous sodium carbonate
Phosphate	Sodium tripolyphosphate
MA/AA	Copolymer of 1:4 maleic/acrylic acid, average molecular weight about 80,000
Polyacrylate	Polyacrylate homopolymer with an average molecular weight of 8,000 sold under the tradename PA30 by BASF GmbH
Zeolite A	Hydrated Sodium Aluminosilicate of formula Na ₁₂ (AlO ₂ SiO ₂) ₁₂ · 27H ₂ O having a primary particle size in the range from 1 to 10 micrometers
Citrate	Tri-sodium citrate dihydrate

(continued)

Citric	Citric Acid
Perborate	Anhydrous sodium perborate monohydrate bleach, empirical formula $\text{NaBO}_2 \cdot \text{H}_2\text{O}_2$
PB4	Anhydrous sodium perborate tetrahydrate
Percarbonate	Anhydrous sodium percarbonate bleach of empirical formula $2\text{Na}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}_2$
TAED	Tetraacetyl ethylene diamine
CMC	Sodium carboxymethyl cellulose
DETPMP	Diethylene triamine penta (methylene phosphonic acid), marketed by Monsanto under the Tradename Dequest 2060
PVP	Polyvinylpyrrolidone polymer
EDDS	Ethylenediamine-N, N'-disuccinic acid, [S,S] isomer in the form of the sodium salt
Suds	25% paraffin wax Mpt 50°C, 17% hydrophobic silica, 58%
Suppressor	paraffin oil
Granular Suds suppressor	12% Silicone/silica, 18% stearyl alcohol, 70%
Sulphate	Starch in granular form
HMWPEO	Anhydrous sodium sulphate
TAE 25	High molecular weight polyethylene oxide
	Tallow alcohol ethoxylate (25)

Detergent Example I

[0115] A granular fabric cleaning composition in accordance with the invention may be prepared as follows:

Sodium linear C_{12} alkyl benzene sulfonate	6.5
Sodium sulfate	15.0
Zeolite A	26.0
Sodium nitrilotriacetate	5.0
Enzyme of the invention	0.1
PVP	0.5
TAED	3.0
Boric acid	4.0
Perborate	18.0
Phenol sulphonate	0.1
Minors	Up to 100

Detergent Example II

[0116] A compact granular fabric cleaning composition (density 800 g/l) in accord with the invention may be prepared as follows:

45AS	8.0
25E3S	2.0
25E5	3.0
25E3	3.0
TFAA	2.5
Zeolite A	17.0
NaSKS-6	12.0
Citric acid	3.0
Carbonate	7.0
MA/AA	5.0
CMC	0.4
Enzyme of the invention	0.1

(continued)

TAED	6.0
Percarbonate	22.0
EDDS	0.3
Granular suds suppressor	3.5
water/minors	Up to 100%

Detergent Example III

[0117] Granular fabric cleaning compositions in accordance with the invention which are especially useful in the laundering of coloured fabrics were prepared as follows:

LAS	10.7	-
TAS	2.4	-
TFAA	-	4.0
45AS	3.1	10.0
45E7	4.0	-
25E3S	-	3.0
68E11	1.8	-
25E5	-	8.0
Citrate	15.0	7.0
Carbonate	-	10
Citric acid	2.5	3.0
Zeolite A	32.1	25.0
Na-SKS-6	-	9.0
MA/AA	5.0	5.0
DETPMP	0.2	0.8
Enzyme of the invention	0.10	0.05
Silicate	2.5	-
Sulphate	5.2	3.0
PVP	0.5	-
Poly (4-vinylpyridine)-N-Oxide/copolymer of vinylimidazole and vinylpyrrolidone	-	0.2
Perborate	1.0	-
Phenol sulfonate	0.2	-
Water/Minors	Up to 100%	

Detergent Example IV

[0118] Granular fabric cleaning compositions in accordance with the invention which provide "Softening through the wash" capability may be prepared as follows:

45AS	-	10.0
LAS	7.6	-
68AS	1.3	-
45E7	4.0	-
25E3	-	5.0
Coco-alkyl-dimethyl hydroxyethyl ammonium chloride	1.4	1.0
Citrate	5.0	3.0
Na-SKS-6	-	11.0
Zeolite A	15.0	15.0
MA/AA	4.0	4.0
DETPMP	0.4	0.4

(continued)

Perborate	15.0	-
Percarbonate	-	15.0
TAED	5.0	5.0
Smectite clay	10.0	10.0
HMWPEO	-	0.1
Enzyme of the invention	0.10	0.05
Silicate	3.0	5.0
Carbonate	10.0	10.0
Granular suds suppressor	1.0	4.0
CMC	0.2	0.1
Water/Minors	Up to 100%	

Detergent Example V

[0119] Heavy duty liquid fabric cleaning compositions in accordance with the invention may be prepared as follows:

	I	II
LAS acid form	-	25.0
Citric acid	5.0	2.0
25AS acid form	8.0	-
25AE2S acid form	3.0	-
25AE7	8.0	-
CFAA	5	-
DETPMP	1.0	1.0
Fatty acid	8	-
Oleic acid	-	1.0
Ethanol	4.0	6.0
Propanediol	2.0	6.0
Enzyme of the invention	0.10	0.05
Coco-alkyl dimethyl hydroxy ethyl ammonium chloride	-	3.0
Smectite clay	-	5.0
PVP	2.0	-
Water / Minors	Up to 100%	

[0120] Improvements in pilling resistance may be determined using the Martindale pilling tester (Swiss standard SN 198525).

[0121] In Example 2, below, a method of determining the reduction of the pilling propensity of polyester fabrics and garments is described.

Additional Benefits from the Method of the Invention

[0122] The present invention is directed to the use of a ETE hydrolytic enzyme and/or a BEB hydrolytic enzyme for reducing the pilling propensity, and find use in a the method of reducing the pilling propensity of polyester fabrics or garments.

[0123] However, from experiments with use of a ETE hydrolytic enzyme and/or a BEB hydrolytic enzyme for reducing the pilling propensity, it has also been found that the method of the present invention allow for improvements in colour clarification. Therefore, in a preferred embodiment, the method of the invention may be carried out simultaneously with conventional colour clarification processes. Colour clarification processes have been described in e.g. EP 220,016; WO 91/17243; WO 89/09259; WO 91/19807; WO 94/07998 and WO 96/29397. In particular, the method of the invention may be carried out simultaneously with a laundry process and in the presence of a cellulytic enzyme.

[0124] The term "colour clarification", as used herein, refers to preservation of the initial colours throughout multiple washing cycles by removing fuzz and pills from the surface of garment and/or fabric. The colour clarification ability

may be determined by measuring the reflectance of the textile. These data are used to calculate the colour difference by use of the Hunter equation, as described in Example 3, below.

[0125] Also the method of the invention allow for improved soil release properties, in particular of oily stains, probably due to increased hydrophilicity of the polyester fibers.

[0126] Finally, the method of the invention was found to improve the antistatic properties of polyester fabrics and/or garments.

EXAMPLES

[0127] The invention is further illustrated with reference to the following examples which are not intended to be in any way limiting to the scope of the invention as claimed.

EXAMPLE 1

Hydrolytic Activity

[0128] This example described an assay for determining the terephthalic acid diethyl ester (ETE) and/or an ethyleneglycol dibenzyl ester (BEB) hydrolytic activity of an enzyme.

ETE Hydrolytic Activity

[0129] An ETE hydrolytic enzyme of the invention is an enzyme capable of hydrolyzing terephthalic acid diethyl ester (ETE), as determined by the following assay.

[0130] In a test tube, 0.250 ml of 0.20 M glycylglycine pH 8.5, and 0.250 ml of 10.0 mM terephthalic acid diethyl ester (ETE) in 1,4-dioxane, is added to 2.000 ml of de-ionized water.

[0131] The mixture is pre-incubated under stirring at 30°C for approximately 15 minutes, followed by the addition of 25.0 µg of enzyme in the lowest possible volume.

[0132] This mixture is then subjected to incubation under stirring at 30°C for 16 hours.

[0133] The reaction mixture is analyzed on a reverse phase HPLC, ODS (octa dodecyl silicate) column, and eluted with increasing concentration of acetonitrile and decreasing concentration of 200 mM NaPO₄, pH 3.0.

[0134] Detection of the reaction products is carried out spectrophotometrically at 240 nm, at which wavelength terephthalic acid and terephthalate derivatives adsorb.

BEB Hydrolytic Activity

[0135] An BEB hydrolytic enzyme of the invention is an enzyme capable of hydrolyzing ethyleneglycol dibenzyl ester (BEB). Dependent on the amount of dioxane present in the assay (BEB is only partially dissolved in a 10% dioxane solution, but fully dissolved in a 30% dioxane solution), the BEB hydrolytic enzyme of the invention may be a BEB¹⁰ hydrolytic enzyme or a BEB³⁰ hydrolytic enzyme, as determined by the following assays.

BEB¹⁰ Hydrolytic Activity

[0136] In a test tube, 0.250 ml of 0.20 M glycylglycine pH 8.5, and 0.250 ml of 10.0 mM ethyleneglycol dibenzyl ester (BEB) in 1,4-dioxane, is added to 2.000 ml of de-ionized water.

[0137] The mixture is pre-incubated under stirring at 30°C for approximately 15 minutes, followed by the addition of 25.0 µg of enzyme in the lowest possible volume.

[0138] This mixture is then subjected to incubation under stirring at 30°C for 16 hours.

[0139] The reaction mixture is analyzed on a reverse phase HPLC, ODS (octa dodecyl silicate) column, and eluted with increasing concentration of acetonitrile and decreasing concentration of 200 mM NaPO₄, pH 3.0.

[0140] Detection of the reaction products is carried out spectrophotometrically at 240 nm, at which wavelength terephthalic acid and terephthalate derivatives adsorb.

BEB³⁰ Hydrolytic Activity

[0141] In a test tube, 0.250 ml of 0.20 M glycylglycine pH 8.5, 0.250 ml of 10.0 mM ethyleneglycol dibenzyl ester (BEB) in 1,4-dioxane, and 0.500 ml of 1,4-dioxane, is added to 1.500 ml of de-ionized water.

[0142] The mixture is pre-incubated under stirring at 30°C for approximately 15 minutes, followed by the addition of 25.0 µg of enzyme in the lowest possible volume.

[0143] This mixture is then subjected to incubation under stirring at 30°C for 16 hours.

[0144] The reaction mixture is analyzed on a reverse phase HPLC, ODS (octa dodecyl silicate) column, and eluted with increasing concentration of acetonitrile and decreasing concentration of 200 mM NaPO₄, pH 3.0.

[0145] Detection of the reaction products is carried out spectrophotometrically at 240 nm, at which wavelength terephthalic acid and terephthalate derivatives adsorb.

Microbial Sources

[0146] A number of enzymes from different microbial sources were subjected to the assay for determining BEB and ETE hydrolytic activity, and the results obtained are presented in Table 1, below:

Table 1;

Enzymes having BEB and/or ETE Hydrolytic Activity; % Degradation of Substrate.			
Enzyme	Substrate		
Microbial Source	BEB ³⁰	BEB ¹⁰	ETE
<i>Humicola insolens</i> ¹⁾	100	100	95
<i>Candida antarctica</i> ²⁾	60	100	100
<i>Pseudomonas cepacia</i> ³⁾	95	-	60
<i>Candida cylindracea</i> ⁴⁾	0	100	15
GA ⁵⁾	0	0	5

1) *Humicola insolens* cutinase (actually a lipase also having cutinase activity) obtained from the strain DSM 1800 as described in Example 2 of US 4,810,414.

2) *Candida antarctica* Component B obtained as described in Example 10 of WO 88/02775.

3) *Pseudomonas cepacia* obtained as described in EP 331,376.

4) *Candida cylindracea* (syn. *Candida rugosa*) lipase obtained from Nippon Oil & Fats Co. Ltd., Japan).

5) Glucosaminated Lipolase™ obtained as described in Example 7A of WO 95/09909.

EXAMPLE 2

Reduced Pilling Propensities

[0147] This example describes an assay for determining the reduction of pilling propensity of polyester fabrics and garments.

[0148] 200 ml Britton-Robinson buffer pH 7.5 added 0.2 g/l Lutensol TO5 (BASF) is added to each Launder-O-meter beaker including 5 steel balls. The beakers are equilibrated at 50°C. Two knitted polyester/cotton (50/50%) swatches (approx. 14x14 cm each) are added to each Launder-O-meter beaker. Enzyme (*Humicola insolens* cutinase) is added at different dosages (0.01%-0.2% on weight of fabric) including a blank without enzyme. The swatches are incubated 2 hours at 50°C in the Launder-O-meter. After incubation the swatches are given a short rinse in a household laundry machine and tumble dried.

[0149] The cycle of incubation and rinsing/drying is repeated once or until the swatches differs in respect to pilling propensity.

[0150] Improvement in pilling resistance is measured using the Martindale pilling tester (Swiss standard SN 198525). An improvement is considered significant if the pilling grade is improved more than half a grade.

EXAMPLE 3

Colour Clarification

[0151] This example describes an assay for determining the colour clarification ability on polyester fabrics.

[0152] A dyed polyester/cotton fabric that has been pre-washed e.g. 10 times in a household laundry machine in order to obtain a matted and pilled appearance of the fabric surface is used as a test swatch.

[0153] 150 ml Britton-Robinson buffer pH 7.5 added 0.2 g/l Lutensol TO5 (BASF) is added to each Launder-O-meter beaker including 5 steel balls. The beakers are equilibrated at 50°C. Two knitted pre-washed polyester/cotton (50/50%)

swatches (approx. 10x10 cm each) are added to each Launder-O-meter beaker. Enzyme (*Humicola insolens* cutinase) is added at different dosages (0.01%-0.2% on weight of fabric) including a blank without enzyme. The swatches are incubated 2 hours at 50°C in the Launder-O-meter. After incubation the swatches are given a short rinse in a household laundry machine and tumble dried. The cycle of incubation and rinsing/drying is repeated once or until the swatches clearly differed in respect to color (fuzz) on the swatches.

[0154] Finally, the swatches are graded visually against the blank (no enzyme) and the colour difference are measured using a reflectance spectrophotometer. The colour clarification ability of the enzyme can be detected by measuring the colour difference between the enzyme treated swatch and the blank. The Hunter L co-ordinate, among others (e.g. CIE Lab L*) may be used for this purpose (AATCC Test Method 153-1985 "Color Measurements of Textiles: Instrumental")

Claims

1. A method of reducing the pilling propensity of polyester fabrics and/or garments, which method comprises treating the fabric or garment with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme) and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme), and which method is carried out simultaneously with laundering of the fabric and/or garment in the presence of a detergent.
2. The method according to claim 1, wherein the fabric or garment is treated with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme).
3. The method according to claim 1, wherein the fabric or garment is treated with an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme).
4. The method according to any of claims 1-3, which method is carried out in presence of one or more detergent enzymes, in particular proteases, lipases, amylases, cellulases, peroxidases, oxidases, and pectinases.
5. The method according to any of claims 1-3, which method is carried out in presence of a cellulytic enzyme.
6. Use of a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme) and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme) and a detergent, in a method for reducing the pilling propensity of polyester fabrics and/or garments which method is carried out simultaneously with laundering of the fabric and/or garment.
7. The use according to claim 6, wherein the fabric or garment is treated with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme).
8. The use according to claim 6, wherein the fabric or garment is treated with an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme).
9. The use according to any of claims 6-8, which method is carried out in presence of one or more detergent enzymes, in particular proteases, lipases, amylases, cellulases, peroxidases, oxidases, and pectinases.
10. The use according to any of claims 6-8, which method is carried out in presence of a cellulytic enzyme.
11. A method of colour clarification of polyester fabrics and/or garments, which method comprises treating the fabric or garment with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme) and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme), and which method is carried out simultaneously with laundering of the fabric and/or garment in the presence of a detergent.
12. The method according to claim 11, wherein the fabric or garment is treated with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme).
13. The method according to claim 12, wherein the fabric or garment is treated with an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme).
14. The method according to any of claims 11-13, which method is carried out in presence of one or more detergent

enzymes, in particular proteases, lipases, amylases, cellulases, peroxidases, oxidases, and pectinases.

15. The method according to any of claims 11-13, which method is carried out in presence of a cellulytic enzyme.
- 5 16. Use of a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme) and/or an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme) and a detergent, in a method of improving colour clarity of polyester fabrics and/or garments which method is carried out simultaneously with laundering of the fabric and/or garment.
- 10 17. The use according to claim 16, wherein the fabric or garment is treated with a terephthalic acid diethyl ester hydrolytic enzyme (ETE hydrolytic enzyme).
18. The use according to claim 17, wherein the fabric or garment is treated with an ethyleneglycol dibenzyl ester hydrolytic enzyme (BEB hydrolytic enzyme).
- 15 19. The use according to any of claims 16-18, which method is carried out in presence of one or more detergent enzymes, in particular proteases, lipases, amylases, cellulases, peroxidases, oxidases, and pectinases.
- 20 20. The use according to any of claims 16-18, which method is carried out in presence of a cellulytic enzyme.

Patentansprüche

- 25 1. Verfahren zum Reduzieren der Neigung zur Fusselbildung von Polyestergeweben und/oder -kleidungsstücken, wobei das Verfahren das Behandeln des Gewebes oder Kleidungsstücks mit einem Terephthalsäurediethylester-hydrolytischen Enzym (ETE-hydrolytischen Enzym) und/oder einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) umfasst, und wobei das Verfahren gleichzeitig mit der Wäsche des Gewebes und/oder Kleidungsstücks in Gegenwart eines Detergents durchgeführt wird.
- 30 2. Verfahren nach Anspruch 1, wobei das Gewebe oder Kleidungsstück mit einem Terephthalsäurediethylester-hydrolytischen Enzym (ETE-hydrolytischen Enzym) behandelt wird.
3. Verfahren nach Anspruch 1, wobei das Gewebe oder Kleidungsstück mit einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) behandelt wird.
- 35 4. Verfahren nach einem der Ansprüche 1-3, wobei das Verfahren in Gegenwart von einem oder mehreren Detergensenzym/en, insbesondere Proteasen, Lipasen, Amylasen, Zellulasen, Peroxidasen, Oxidasen und Pektinasen durchgeführt wird.
- 40 5. Verfahren nach einem der Ansprüche 1-3, wobei das Verfahren in Gegenwart eines zellulytischen Enzyms durchgeführt wird.
6. Verwendung eines Terephthalsäurediethylester-hydrolytischen Enzyms (ETE-hydrolytischen Enzyms) und/oder eines Ethylenglycoldibenzylester-hydrolytischen Enzyms (BEB-hydrolytischen Enzyms) und eines Detergents in einem Verfahren zum Reduzieren der Neigung zur Fusselbildung von Polyestergeweben und/oder -kleidungsstücken, wobei das Verfahren gleichzeitig mit der Wäsche des Gewebes oder Kleidungsstücks durchgeführt wird.
- 45 7. Verwendung nach Anspruch 6, wobei das Gewebe oder Kleidungsstück mit einem Terephthalsäurediethylester-hydrolytischen Enzyms (ETE-hydrolytischen Enzyms) behandelt wird.
- 50 8. Verwendung nach Anspruch 6, wobei das Gewebe oder Kleidungsstück mit einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) behandelt wird.
9. Verwendung nach einem der Ansprüche 6-8, wobei das Verfahren in Gegenwart von einem oder mehreren Detergensenzym/en, insbesondere Proteasen, Lipasen, Amylasen, Zellulasen, Peroxidasen, Oxidasen und Pektinasen durchgeführt wird.
- 55 10. Verwendung nach einem der Ansprüche 6-8, wobei das Verfahren in Gegenwart eines zellulytischen Enzyms

durchgeführt wird.

11. Verfahren zum Farbklären von Polyestergeweben und/oder -kleidungsstücken, wobei das Verfahren das Behandeln des Gewebes oder Kleidungsstücks mit einem Terephthalsäurediethylester-hydrolytischen Enzym (ETE-hydrolytischen Enzym) und/oder einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) umfasst, und wobei das Verfahren gleichzeitig mit der Wäsche des Gewebes und/oder Kleidungsstücks in Gegenwart eines Detergents durchgeführt wird.
12. Verfahren nach Anspruch 11, wobei das Gewebe oder Kleidungsstück mit einem Terephthalsäurediethylester-hydrolytischen Enzym (ETE-hydrolytischen Enzym) behandelt wird.
13. Verfahren nach Anspruch 12, wobei das Gewebe oder Kleidungsstück mit einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) behandelt wird.
14. Verfahren nach einem der Ansprüche 11-13, wobei das Verfahren in Gegenwart von einem oder mehreren Detergensenzym/en, insbesondere Proteasen, Lipasen, Amylasen, Zellulasen, Peroxidasen, Oxidasen und Pektinasen durchgeführt wird.
15. Verfahren nach einem der Ansprüche 11-13, wobei das Verfahren in Gegenwart eines zellulolytischen Enzyms durchgeführt wird.
16. Verwendung eines Terephthalsäurediethylester-hydrolytischen Enzyms (ETE-hydrolytischen Enzyms) und/oder eines Ethylenglycoldibenzylester-hydrolytischen Enzyms (BEB-hydrolytischen Enzyms) und eines Detergents in einem Verfahren zum Verbessern der Farbkларheit von Polyestergeweben und/oder -kleidungsstücken, wobei das Verfahren gleichzeitig mit der Wäsche des Gewebes und/oder Kleidungsstücks durchgeführt wird.
17. Verwendung nach Anspruch 16, wobei das Gewebe oder Kleidungsstück mit einem Terephthalsäurediethylester-hydrolytischen Enzym (ETE-hydrolytischen Enzyms) behandelt wird.
18. Verwendung nach Anspruch 16, wobei das Gewebe oder Kleidungsstück mit einem Ethylenglycoldibenzylester-hydrolytischen Enzym (BEB-hydrolytischen Enzym) behandelt wird.
19. Verwendung nach einem der Ansprüche 16-18, wobei das Verfahren in Gegenwart von einem oder mehreren Detergensenzym/en, insbesondere Proteasen, Lipasen, Amylasen, Zellulasen, Peroxidasen, Oxidasen und Pektinasen durchgeführt wird.
20. Verwendung nach einem der Ansprüche 16-18, wobei das Verfahren in Gegenwart eines zellulolytischen Enzyms durchgeführt wird.

Revendications

1. Un procédé pour réduire l'aptitude au boulochage de tissus et/ou de vêtements en polyester, lequel procédé consiste à traiter le tissu ou le vêtement avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE) et/ou une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB), et lequel procédé est mis en oeuvre simultanément avec un blanchiment du tissu et/ou du vêtement en présence d'un détergent.
2. Le procédé selon la revendication 1, dans lequel le tissu ou le vêtement est traité avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE).
3. Le procédé selon la revendication 1, dans lequel le tissu ou le vêtement est traité avec une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB).
4. Le procédé selon l'une quelconque des revendications 1 à 3, lequel procédé est mis en oeuvre en présence d'une ou plusieurs enzymes détergentes, en particulier les protéases, les lipases, les amylases, les cellulases, les peroxydases, les oxydases et les pectinases.

5. Le procédé selon l'une quelconque des revendications 1 à 3, lequel procédé est mis en oeuvre en présence d'une enzyme cellulytique.
6. Utilisation d'une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE) et/ou d'une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB) et d'un détergent dans un procédé pour réduire l'aptitude au boulochage de tissus et/ou de vêtements en polyester, lequel procédé est mis en oeuvre simultanément avec un blanchiment du tissu et/ou du vêtement.
7. Utilisation selon la revendication 6, dans laquelle le tissu ou le vêtement est traité avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE).
8. Utilisation selon la revendication 6, dans laquelle le tissu ou le vêtement est traité avec une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB).
9. Utilisation selon l'une quelconque des revendications 6 à 8, où le procédé est mis en oeuvre en présence d'une ou plusieurs enzymes détergentes, en particulier de protéases, de lipases, d'amylases, de cellulases, de peroxydases, d'oxydases et de pectinases.
10. Utilisation selon l'une quelconque des revendications 6 à 8, où le procédé est mis en oeuvre en présence d'une enzyme cellulytique.
11. Un procédé de clarification de couleur de vêtements et/ou de tissus en polyester, lequel procédé consiste à traiter le tissu ou le vêtement avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE) et/ou une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB) et dans lequel le procédé est mis en oeuvre simultanément avec un blanchiment du tissu et/ou du vêtement en présence d'un détergent.
12. Le procédé selon la revendication 11, dans lequel le tissu ou le vêtement est traité avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE).
13. Le procédé selon la revendication 12, dans lequel le tissu ou le vêtement est traité avec une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB).
14. Le procédé selon l'une quelconque des revendications 11 à 13, lequel procédé est mis en oeuvre en présence d'une ou plusieurs enzymes détergentes, en particulier les protéases, lipases, amylases, cellulases, peroxydases, oxydases et pectinases.
15. Le procédé selon l'une quelconque des revendications 11 à 13, lequel procédé est mis en oeuvre en présence d'une enzyme cellulytique.
16. Utilisation d'une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE) et/ou d'une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB) et d'un détergent dans un procédé pour améliorer la clarté de couleur de tissus et/ou de vêtements en polyester, lequel procédé est mis en oeuvre simultanément avec un blanchiment du tissu et/ou du vêtement.
17. Utilisation selon la revendication 16, dans laquelle le tissu ou le vêtement est traité avec une enzyme hydrolytique de diéthyl ester d'acide téréphtalique (enzyme hydrolytique ETE).
18. Utilisation selon la revendication 17, dans laquelle le tissu ou le vêtement est traité avec une enzyme hydrolytique de dibenzyl ester d'éthylène glycol (enzyme hydrolytique BEB).
19. Utilisation selon l'une quelconque des revendications 16 à 18, où le procédé est mis en oeuvre en présence d'une ou plusieurs enzymes détergentes, en particulier les protéases, les lipases, les amylases, les cellulases, les peroxydases, les oxydases et les pectinases.
20. Utilisation selon l'une quelconque des revendications 16 à 18, lequel procédé est mis en oeuvre en présence d'une enzyme cellulytique.
